## QUICKWRAP HEAT SHRINK WRAPAROUND SLEEVES FROM DSG-CANUSA DELIVER COST SAVINGS UP TO 80% IN RETROFIT APPLICATIONS.

Through close interaction with its customers, DSG-Canusa, a leading manufacturer of heat shrink products, has developed the QuickWrap line of wraparound sleeves that offer complete environmental protection and substantial cost savings for the electrical, shipboard and communications industries.

DSG-Canusa's QuickWrap product line was developed by adapting our industry leading medium and heavy wall insulation products into wraparound sleeves. With QuickWrap's innovative closure mechanism, the industry leading adhesive performance and split resistance material characteristics of CFM, CFW and FCFW can be applied to retrofit and repair applications without the use of conventional tubing. In typical retrofit and repair situations users are faced with the choice of utilizing inferior tapes or incurring lengthy downtimes to disconnect and re-apply an insulating tube. The QuickWrap product line allows for quick retrofit protection of connectors, deteriorated splices and cable damage all with the trusted long term sealing and insulating properties of heat shrink tubing.

In telecom applications retrofit protection of connectors typically requires a prolonged and disruptive disconnection process when re-applying insulation covers. By using QuickWrap, operators have been able to reduce their labour and total installed costs by 80% and, more importantly, avoid disruptions to their service as there is no need for disconnection.

The QuickWrap product has infinite uses. Some typical costs saving applications are listed below.

- CFM QuickWrap - available in diameters up to 9 in for re-jacketing or retrofit insulation of electrical connections using 3:1 shrink ratio, medium wall jacket material
- CFW QuickWrap - uses a heavy wall jacket for rugged retrofit work in the electrical industry
- FCFW QuickWrap - a heavy wall, flame retardant jacket that is ideal for retrofit production in shipboard applications
